

6. User Acceptance Testing (UAT) and Defect Management

6.1. UAT Execution

User Acceptance Testing is conducted to confirm that the NovaTech Salesforce system meets the needs of key stakeholders before deployment. In this stage, representative users from Sales, Customer Service, Finance, and IT will test the system using real business scenarios based on the prepared UAT test cases. The purpose of UAT execution is to make sure that the system is acceptable from the user's perspective.

Key Stakeholders Involved

1. Sales Manager: tests sales pipeline, lead assignment, team activity monitoring, and sales reports
2. Sales Representative: tests lead stages, opportunity stages, client information, and follow-up records
3. Customer Service Manager: tests service dashboards, SLA monitoring, unresolved cases, and escalation process
4. Customer Service Agent: tests case creation, case updates, case status, customer history, communication history, and Sales handoff
5. Finance Manager: tests financial data monitoring, financial reports, and financial approval process
6. Finance Analyst: tests confirmed sales orders, invoice-related information, payment tracking, and financial dashboards
7. IT Manager: tests Salesforce configuration, security monitoring, integration, and data migration monitoring
8. IT Administrator: tests user account management, roles, permissions, audit logs, backup, and recovery support

UAT Preparation

Project team must prepare:

1. UAT test cases based on user stories and acceptance criteria
2. Test user accounts for each stakeholder role
3. Sample test data for Sales, Customer Service, Finance, and IT scenarios
4. Salesforce testing environment or sandbox
5. UAT schedule
6. UAT result form or feedback document
7. Defect tracking document to record issues found during testing

UAT Execution Process

The UAT Execution will be conducted through the following steps:

1. Explain the UAT process to stakeholders

2. Provide access to the test environment
3. Execute UAT test case
4. Record test results
5. Collect stakeholders feedback
6. Fix and retest issues
7. Get stakeholder approval

6.2. Defect Tracking

In NovaTech, defects may be found when stakeholders test sales, customer service, finance, and IT features during UAT. The purpose of defect tracking is to make sure every issue found during UAT is documented, assigned, fixed, retested, and closed before the system is deployed.

The process of defect tracking are:

1. Identify the defect: during testing, if the result/output is different from the expected result, the issue is recorded as defect
2. Record the defect: each defect must be recorded in a defect tracking document, such as a spreadsheet or other project management tool. It should include defect ID, related user story, user role, severity level, defect description, expected result, actual result, etc.
3. Assign the defect: after the defect is recorded, it should be assigned to the responsible team member
4. Fix the defect: the assigned person investigates the issue and applies the required fix. The fix may involve updating Salesforce configuration, changing validation rules, adjusting role permissions, correcting report filters, or fixing system logic
5. Retest the defect: after the defect is fixed, the stakeholder retests the same scenario to check whether the issue has been solved
6. Close the defect: a defect can be closed when the issue has been fixed, the feature has been retested, the actual result matched the expected result, and stakeholder confirms that the defect is resolved

6.2.1. Defect Prioritization

1. Critical

- a. Priority level: urgent
- b. Impact:
 - Users cannot log in
 - Main Salesforce features cannot be accessed
 - System crashes
 - Major data loss
- c. Action: must be fixed immediately

2. High

- a. Priority level: high
- b. Impact:
 - Sales cannot manage leads

- Customer Service cannot create cases
 - Finance cannot track payment status
 - Users can access restricted data
 - c. Action: should be fix as soon as possible
- 3. Medium**
- a. Priority level: medium
 - b. Impact:
 - Report data is incomplete
 - Dashboard displays incorrect totals
 - Validation message is unclear
 - Some filters do not work properly
 - c. Action: should be fixed before deployment if it affects user decision-making
- 4. Low**
- a. Priority level: low
 - b. Impact:
 - Minor text error
 - Layout issue
 - Label inconsistency
 - Small formatting problem
 - Action: can be fixed after higher-priority defects are resolved

6.3. Defect Resolution

Defect resolution is the process of fixing defects that are found during testing or user acceptance testing. The purpose of defect resolution is to make sure that every defect found during testing is reviewed, fixed, and verified to the relevant stakeholders before it is released.

There are 3 steps involving defect resolution:

1. Prioritize defect

The first step is to analyze the system's defect and what impact does the defect give to the system. The project team must determine how serious the defect is and how urgently it needs to be fixed. The team should be able to answer a few question, including:

- Is the defect reported previously or not?
- How serious is the defect?
- What steps should be taken to reduce the impact of defects prior to fix?
- Which user role is affected?

2. Resolve defect

After a defect has been prioritized, the development team will resolve the defect based on its priority level. Some defects must be fixed immediately, while lower-priority defects can be fixed later depending on their impact and available resources. In this step, the team will investigate the cause of defect, identify

cause of issue, apply required fix, update the affected Salesforce component, and test the fixed feature.

3. Report resolution

After the features are fixed, developers will report the resolution to the testing team and relevant stakeholders. This step is important so that everyone knows when and how the defect was resolved
